

Report Esercitazione: Configurazione Monitor Local Event Logs in Splunk

Studente: Diego Warnà

Data: 26 Agosto 2026

Oggetto: Configurazione input di monitoraggio per Windows Event Logs in Splunk Enterprise.

1. Obiettivo

L'obiettivo dell'esercitazione è stato configurare la modalità di monitoraggio ("Monitor") in Splunk Enterprise per raccogliere e indicizzare i log di sistema locali (Windows Event Logs) dal server `EpicodeServer`. Il processo ha incluso la creazione dell'input, la verifica dello stato di configurazione e la validazione dell'arrivo dei dati.

2. Procedura Eseguita

Fase 1: Selezione della Sorgente Dati

È stata avviata la procedura guidata "Add Data" dall'interfaccia web di Splunk.

- Tipo di Input Selezionato: `Local Event Logs`
- Obiettivo: Monitorare i canali log locali dove le applicazioni e i processi di sistema inviano dati.
- Log Selezionati: Sono stati selezionati i canali principali di Windows:

Monitor

files and ports on this Splunk platform instance

Files - HTTP - WMI - TCP/UDP - Scripts

Modular inputs for external data sources

Local Event Logs

Collect event logs from this machine.

Remote Event Logs

Collect event logs from remote hosts. Note: this uses WMI and requires a domain account.

Files & Directories

Upload a file, index a local file, or monitor an entire directory.

HTTP Event Collector

Configure tokens that clients can use to send data over HTTP or HTTPS.

TCP / UDP

Configure the Splunk platform to listen on a network port.

Local Performance Monitoring

Collect performance data from this machine.

Remote Performance Monitoring

Collect performance and event information from remote hosts. Requires domain credentials.

Configure this instance to monitor local Windows Event Log channels where installed applications, services, and system processes send data. This monitor runs once for every Event Log input that you define. [Learn More](#)

FAQ

> What event logs does this Splunk platform instance have access to?

> What is the best method for monitoring event logs of remote Windows machines?

Fase 2: Configurazione Input Settings

Nella fase di configurazione, sono stati impostati i seguenti parametri per l'indicizzazione:

Input Settings

Optionally set additional input parameters for this data input as follows:

Host

When the Splunk platform indexes data, each event receives a "host" value. The host value should be the name of the machine from which the event originates. The type of input you choose determines the available configuration options. [Learn More](#)

Host field value

EpicodeServer

Index

The Splunk platform stores incoming data as events in the selected index. Consider using a "sandbox" index as a destination if you have problems determining a source type for your data. A sandbox index lets you troubleshoot your configuration without impacting production indexes. You can always change this setting later. [Learn More](#)

Local Windows host monitoring Collect up-to-date hardware and software (Computer, Operating System, Processor, Service, Disk, Network Adapter and Application) information about this machine.	0	+ Add new
Local Windows network monitoring This is an input for Splunk Network Monitor.	0	+ Add new
Local Windows print monitoring Collect information about printers, printer jobs, print drivers, and print ports on this machine.	0	+ Add new

4. Conclusione

L'esercizio ha avuto successo. La modalità "Monitor" è stata configurata correttamente per i log locali di Windows. Splunk sta ora raccogliendo attivamente gli eventi dal server `EpicodeServer` e indicizzandoli nell'indice specificato.
